

SETUP INSTRUCTIONS FOR ASTROPHYSICS WORKSHOP

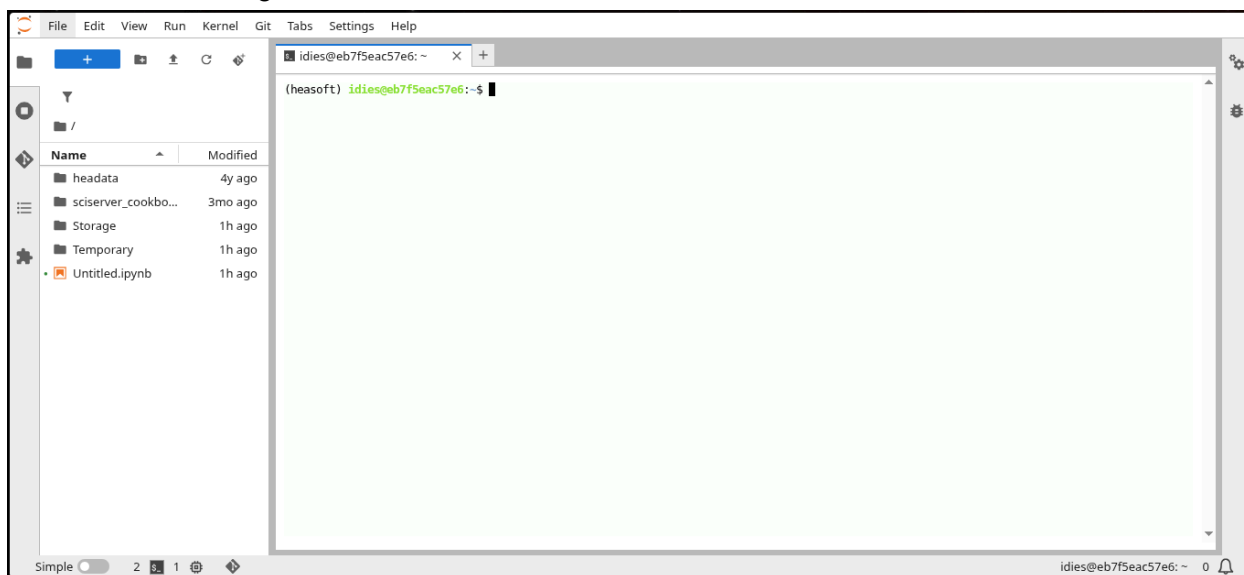

For those who are not unable to setup HEASoft locally, or WSL, or on VirtualBox. This method is pure online and works on every computer.

Please follow these instructions to run HEASoft successfully:

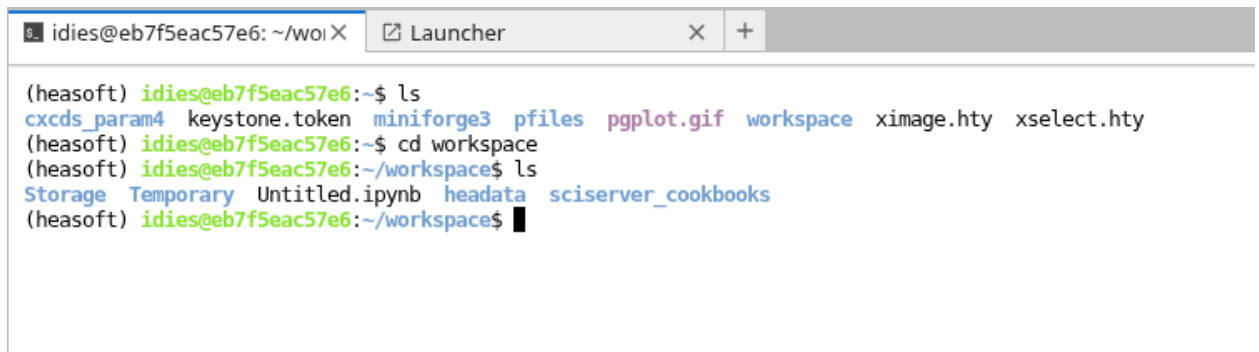

1. Create an account at <https://sciserver.org>
2. Go to the Compute page from the home page or by selecting it from the grid icon at the top right of the page.
3. Create a container, select the HEASARC compute image (HEASARCv6.36), select a user volume, and finally make sure HEASARC data is checked under data volumes.
4. Go to the container by clicking its name in the list of containers. This will launch the JupyterLab interface, which gives you access to a virtual machine with HEASoft and other high-energy software installed, along with all the HEASARC data available locally. You can either work on a notebook (Python) or launch a terminal.
5. Click on the name of the container

Containers					
Created At	Name	Domain	Image	Status	
2026-02-04 13:56:49.0	SXPC-WOAC	Interactive	HEASARCv6.36	running	■ ⓘ ✕
Create container					

6. The Jupyter notebook interface will open.
7. Scroll down and select the “Terminal” option in the “Other” category
8. A terminal will open with HEASoft installed. Now you can do all the work of HEASoft inside the terminal.
9. It will look something like this

10. Now go to this [link](#) and download all three spectra files from the drive.
11. Upload the spectra files to the workspace
12. Now go to the workspace directory by following command

```
idies@eb7f5eac57e6: ~/woi X Launcher X +
(heasoft) idies@eb7f5eac57e6:~$ ls
cxcds_param4  keystone.token  miniforge3  pfiles  pgplot.gif  workspace  ximage.hty  xselect.hty
(heasoft) idies@eb7f5eac57e6:~$ cd workspace
(heasoft) idies@eb7f5eac57e6:~/workspace$ ls
Storage Temporary  Untitled.ipynb  headata  sciserver_cookbooks
(heasoft) idies@eb7f5eac57e6:~/workspace$
```

13. Now you are all set... We will learn about spectral analysis in hands-on session.
